In genetics, a test cross, first introduced by Gregor Mendel, involves the breeding of an individual with a phenotypically recessive individual, in order to determine the zygosity of the former by analyzing proportions of offspring phenotypes. Zygosity can either be heterozygous or homozygous. Those that are heterozygous have one dominant and one recessive allele.

Plant genetics is the study of genes, genetic variation, and heredity specifically in Plants. It is generally considered a field of biology and botany, but intersects frequently with many other life sciences and is strongly linked with the study of information systems. Plant genetics is similar in many ways to animal genetics but differs in a few key areas.

I have just started reading your book On the Origins of New Forms of Life. By training, I am a theoretical linguist, not a biologist, but I have been drawn more and more to (evolutionary) biology during the last few years, and getting very frustrated with the Neo-Darwinian framework that blinds us to interesting questions.
